Transcranial Magnetic Stimulation is a non-invasive treatment for people who suffer from pharmaceutically-resistant depression using pulsed magnetic fields that are repetitively transferred into the left prefrontal cortex. The treatment is an outpatient procedure in which the patient is completely AWAKE and alert. TMS is a 37-minute treatment, five days a week, for approximately 4-6 weeks in which time the patient is reclined in a comfortable chair and able to practice meditation techniques, watch TV, listen to music, or read books. TMS therapy is NOT the same as ECT. The treatment is known to have minimal to no side-effects and produces a very high success rate!
